### **DETAILED ACTION**

Page 2

1. This communication is in response to Remarks filed 08/21/2005.

2. Claims 1-19 are pending in the application. Claim 1 is independent.

# Response to Arguments

3. Applicant's arguments, see Remarks, filed 8/21/2005, with respect to the rejection(s) of claim(s) 1-19 under 35 USC 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Delugach et al. (Wizard: A Database Inference Analysis and Detection System).

## Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1-6 and 14-19 are rejected under 35 U.S.C. 102(b) as being anticipated by Delugach et al.

Art Unit: 2654

As to claims 1 and 14, Delugach et al. teach:

a computer readable media containing instructions (a system to analyze and search databases based on a user input, page 56);

parsing text to identify paths formed by concatenated relationships between words in the text (identifying paths formed between words by identifying the relationships between those words, col. 1, paragraph 2, page 58); and

generating a database of inference rules comprising pairs of semantically equivalent paths by associating, in a computer, paths with each other based on a similarity measure between the paths (paths are placed into layers within a database based on their facet, such as inference rules where if fire produces smoke, then if fire is seen we can infer smoke, or used-for relationships, where hammer is used for nailing, then if existence of a nailing activity infers that hammer exists, (page 59, section 3.3) and where the entities are ranked on a goodness measure, page 60, col. 2, paragraph 1).

As to claims 2 and 15, Delugach et al. teach the similarity measure is based on frequency of occurrence of words in a path (finding the number of entities or activities that can be inferred through a given association, based on the frequency of occurrence of words in a path, (page 60, col. 2 paragraph 1, and 61, col. 1, section 4.1.2). Where it would be necessary that since within finding what can be inferred, a similarity between the associations would also be found).

As to claims 3 and 16, Delugach et al. teach the words are at the end points of the paths (words are at the endpoint of the paths, page 61, col. 1, section 4.1.2).

As to claims 4 and 17, Delugach et al. teach the step of associating paths with each other comprises the step of counting occurrences of words at the end points of specific paths (associating paths that end with the same word, such as "battery" so that different devices that are able to use a battery can be inferred when battery is seen within a path, col. 1, section 4.1.2, page 61).

As to claims 5 and 18, Delugach et al. teach the step of associating paths comprises the step of comparing counts of occurrences of words and associating paths based on the counts of occurrences of the words (associating paths that contain the occurrence of "battery", so that different devices that use a batter can be inferred when a battery is seen within a path, col. 1, section 4.1.2, page 61).

As to claims 6 and 19, Delugach et al. teach paths are associated only when the similarity measure exceeds a threshold (paths are group based on the amount of inferable items that can be inferred from a given item, the paths are grouped into four groups based on a rating, page 61, col. 1 and 2, where it would be obvious that a threshold value would be used to properly separate the paths into their sections).

Art Unit: 2654

## Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 7, and 9-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Delugach et al. as applied to claim 1 above, and further in view of the applicants' prior art.

As to claim 7, Delugach et al. do not teach:

initiating a search for electronic information; nor

expanding the search by reference to associated paths in a database constructed according to the method of claim 1.

However, the applicants' indicated prior art teaches it is known in the art of information retrieval to identify phrasal terms from queries and generate variants for query expansion (specification page 2, lines 20-25).

Therefore it would have been obvious to combine the teachings of Delugach et al. with the query expansion method as described by the applicants' prior art since query expansion is now to promote effective retrieval of information as disclosed in the applicants' prior art (specification page 2, lines 20-25).

Art Unit: 2654

As to claim 9, Delugach et al. teach the similarity measure is based on frequency of occurrence of words in a paths (finding the number of entities or activities that can be inferred through a given association, based on the frequency of occurrence of words in a path, (page 60, col. 2 paragraph 1, and 61, col. 1, section 4.1.2). Where it would be necessary that since within finding what can be inferred, a similarity between the associations would also be found).

As to claim 10, Delugach et al. teach the words are at the end points of the paths (words are at the endpoint of the paths, page 61, col. 1, section 4.1.2).

As to claim 11, Delugach et al. teach the step of associating paths with each other comprises the step of counting occurrences of words at the end points of specific paths (associating paths that end with the same word, such as "battery" so that different devices that are able to use a battery can be inferred when battery is seen within a path, col. 1, section 4.1.2, page 61).

As to claim 12, Delugach et al. teach the step of associating paths comprises the step of comparing counts of occurrences of words and associating paths based on the counts of occurrences of the words (associating paths that contain the occurrence of "battery", so that different devices that use a batter can be inferred when a battery is seen within a path, col. 1, section 4.1.2, page 61).

As to claim 13, Delugach et al. teach paths are associated only when the similarity measure exceeds a threshold (paths are group based on the amount of inferable items that can be inferred from a given item, the paths are grouped into four groups based on a rating, page 61, col. 1 and 2, where it would be obvious that a threshold value would be used to properly separate the paths into their sections).

8. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Delugach et al. in view of the applicants' prior art as applied to claim 7 above, and further in view of Zadrozny et al. (5,937,385).

As to claim 8, Delugach et al. and the applicant's prior art do not teach the search is initiated from a location remote from the location of the database.

However, Zadrozny et al. teach initiating the search from a remote location (Fig. 1A).

Therefore it would have been obvious to combine the teachings of Delugach et al. with the query expansion method of the applicants' prior art and with the remote search technique of Zadrozny et al. to increase the flexibility of the system, as more user can connect to the system from different locations, as taught by Zadrozny et al. (col. 1, lines 15-20).

Art Unit: 2654

### Conclusion

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Thomas E. Shortledge whose telephone number is (571)272-7612. The examiner can normally be reached on M-F 8:00 - 4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richemond Dorvil can be reached on (571)272-7602. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
